

# Guide for capturing a Trail

In order to capture a rich media trail experience we recommend the following:

## GPS tracking device

- Trailburning uses the **GPX data format** used by most GPS watches and Smartphone tracking apps. If you do not have a tracking app then we recommend Strava.com.
- Set device time to **correct local time**.
- When starting the trail ensure GPS device has **satellite reception** before commencing.

## Media capture device (camera)

- Set device time to **correct local time**.
- Device does not need to be GPS enabled so for devices with GPS you may **disable the GPS to save battery**.
- The higher the quality of the captured still image the better.  
A **dedicated (SLR) camera** will usually be better than a Smartphone camera.
- Photos should be captured in **landscape format**.

## Tell your Trail story

- Try and capture imagery that showcases the **scenery of the trail** such as interesting land marks and the terrain. Usually pausing to compose and take your photos will produce the best results.
